Dear Mr Lippert,

When a spill of greater than two tablespoons occurs in a home it is imperative that the home be evacuated until an assessment and mitigation occurs. If the spill occurring at **Non-Responsive** Canterbury is greater than 2 tablespoons, which I understand it is, then the house shall be evacuated until the spill is mitigated and cleaned to the point at which habitation can occur. A methyl mercury vapor gas detector should be used to determine the amount of mercury to be less than 5000 nanograms per cubic meter of air prior to habitation of the home. Please call me at **Non-Responsive** if more direction is needed.
